 Department of Veterans Affairs	Consent For Clinical Treatment/Procedure
A. IDENTIFICATION	

1. Patient name, Social Security Number, and Date of Birth:

ZZAAVAMC, JOHN TESTMAN
001-23-4567
JAN 02, 1955

2. Decision-making capacity:

The patient HAS decision-making capacity.

3. Name of the treatment(s)/procedure(s):

MEDICATION CHALLENGE TEST

4. Part of the body on which the treatment/procedure will be performed: (Correct site includes the correct side [i.e., left or right] and the precise anatomical part, such as a specific finger. DO NOT ABBREVIATE.)

- See description of treatment/procedure.

5. Practitioner obtaining consent:

Granata, Joseph A (PHARMACIST)

6. Supervising practitioner: (if applicable)

7. Additional practitioner(s) performing or supervising the treatment/procedure: (if not listed above)

B. INFORMATION ABOUT THE TREATMENT/PROCEDURE

8. Reason for treatment/procedure (diagnosis, condition, or indication):

To test a medication before taking it for treatment to make sure it does not cause severe reactions.

9. Brief description of the treatment/procedure:

The goal of the challenge test is to see if you can safely take a medicine that you or your doctor suspects you may not tolerate. This procedure involves giving you a medicine in small, gradual doses, building up to the full dose. This may be a medicine that you will need to take in the future, or a medicine you have taken in the past and had a bad reaction to. Giving you the medicine in small doses at the beginning will help

your doctor decide if you can take it safely.

You may have an IV (intravenous) catheter inserted using a needle. The IV will be placed in a vein, usually in your arm. Your blood pressure, temperature, and pulse will be closely monitored. How you are feeling will also be closely monitored.

Your doctor will decide how much and how often to give you the medicine. You may be given the medicine by mouth, IV, or injected into your muscle. You may also be give the medicine as an injection under the skin, placed on the skin, inhaled, sniffed into the nose, or placed into your eyes. The way the medicine is given depends on the type of medicine, the risk of a reaction, and why it is being given. Usually, you will receive a small dose of the medicine, however it is given. If you have no reaction after a period of time, a larger dose of the medicine will be given until you are able to take the full dose.

The test may be stopped at any time if you have a reaction. Depending on the reaction, you doctor may decide to stop the test. Your doctor may give you a medicine to stop the reaction. Or, you doctor may decide that it is safe to continue the test.

Your doctor will observe you for a period of time after the test is done. This is to make sure you do not have any severe reactions after the test is complete.

10. Potential benefits of the treatment/procedure:

This procedure may allow you and your doctor to know if you may have a serious reaction to a medicine or not. If you do not have a serious reaction, you may be able to safely take a medicine that you or your doctors thought was unsafe for you.

11. Known risks and side effects of the treatment/procedure: (Include potential problems related to the recuperation.)

Known risks of this treatment include, but are not limited to:

- Local pain and/or irritation at the treatment site.
- Nausea and/or vomiting.
- Rash.
- The test can give you a false-negative result. This means that the test does not identify a problem with taking the medication during testing, when you may have a reaction in the future when you take the medication for treatment when there is/may be one.
- The test can give you a false-positive result. This means that you may have a reaction or side effect to the medication during the test but that it might be safe to take the medication in the future.
- Difficulty breathing.
- You may need additional tests or treatment.
- You may need medicines to reverse a bad reaction.
- A serious reaction may be delayed for several hours. This may be life threatening and requires immediate medical attention and treatment.
- Heart attack.
- The most serious side effect is an allergic reaction called anaphylaxis which can be

life-threatening. Anaphylaxis presents with itching, hives, swelling, difficulty breathing, drop in blood pressure, possible loss of consciousness and even death. Anaphylaxis requires immediate medical attention and treatment. This includes going to the hospital and receiving an epinephrine injection.

- Death.

12. Alternatives to the treatment/procedure:

- You may choose not to have this procedure.

13. Anesthesia / Moderate Sedation:

No, neither anesthesia nor moderate sedation will be used in this treatment/procedure.

14. Blood products:

It is not expected that blood products will be used in this treatment/procedure.

15. Additional information

After my surgery, I ask that the medical staff dispose of any of my tissues or body parts that were removed during the treatments/procedures, as long as my doctor or dentist does not think that further pathological examination is needed.

I understand that the practice of medicine, surgery and dentistry is not an exact science and acknowledge that no guarantee can be made concerning the results of the procedures performed.

It has been explained to me that sometimes during a procedure, it can be discovered that an additional procedure is needed immediately. If I need this procedure, I permit the doctors to proceed.

I consent to the photographing, filming, or recording of the procedure, including portions of my body, for medical, scientific, research or educational purposes. When used for any purposes other than the medical record, my identity will not be revealed by the pictures or accompanying text.

16. Comments

C. SIGNATURES

Practitioner obtaining consent:

- All relevant aspects of the treatment and its alternatives (including no treatment) have been discussed with the patient (or surrogate) in language that s/he could understand. This discussion included the nature, indications, benefits, risks, side effects, and likelihood of success of each alternative.
- The patient (or surrogate) demonstrated comprehension of the discussion.
- I have given the patient (or surrogate) an opportunity to ask questions.
- I did not use threats, inducements, misleading information, or make any attempt to coerce the patient/surrogate to consent to this treatment.
- I have offered the patient (or surrogate) the opportunity to review a printed copy of the consent form.

_____ Date/Time: _____

Granata, Joseph A (PHARMACIST)

Patient or surrogate:

PATIENT OR SURROGATE:

By signing below, I attest to the following:

- Someone has explained this treatment/procedure and what it is for.
- Someone has explained how this treatment/procedure could help me, and things that could go wrong.
- Someone has told me about other treatments or procedures that might be done instead, and what would happen if I have no treatment/procedure.
- Someone has answered all my questions.
- I know that I may refuse or change my mind about having this treatment/procedure. If I do refuse or change my mind, I will not lose my health care or any other VA benefits.
- I have been offered the opportunity to read the consent form.
- I choose to have this treatment/procedure.

_____ Date/Time: _____

ZZAAVAMC, JOHN TESTMAN

Witnesses: No witness is required if the patient or surrogate signs their name. Two witnesses are required only when the patient's signature is indicated with an "X" or some other identifying mark.
